章节摘录

In America , researcher James Gauderman and his colleagues followed 1 , 759 children aged 10 to 18 in a dozen of Southern California communities. In the first long-term study of the effect of air pollution on children , they reported that children in the communities with higher levels of air pollution were more likely to have a lung disease. The pollution came mainly from car exhaust , they said. The researchers found that 7.9 percent of the 18-year-olds in the highest pollution areas had lung problems. Among those in the least-polluted areas , 1.6 percent had lung problems. It comes not simply but in pairs. In Mexico City , scientists found air pollution prevented young lungs from growing and working properly , after they studied 3 , 170 eight-year-old children at schools in the city. Air pollution in the Mexico City is more harmful to children than cigarette smoking and may cause lung diseases in later life , Reuters reported. Scientists in both Mexico and America gave people almost the same suggestion—to contribute to cleaner air. For instance , carpooling , taking public transportation , walking or biking to work or school can make a difference.
